

# Evaluation of the Lake Macroinvertebrate Integrity Index (LMII) and Alternate Indices for Eastern US Lakes and Reservoirs

*Sheila North/Dynamac Corp. c/o USEPA ORD-NERL, James Kurtenbach/USEPA Region II,  
Karen Blocksom/USEPA ORD-NHEERL, Frank Borsuk/USEPA Region III*

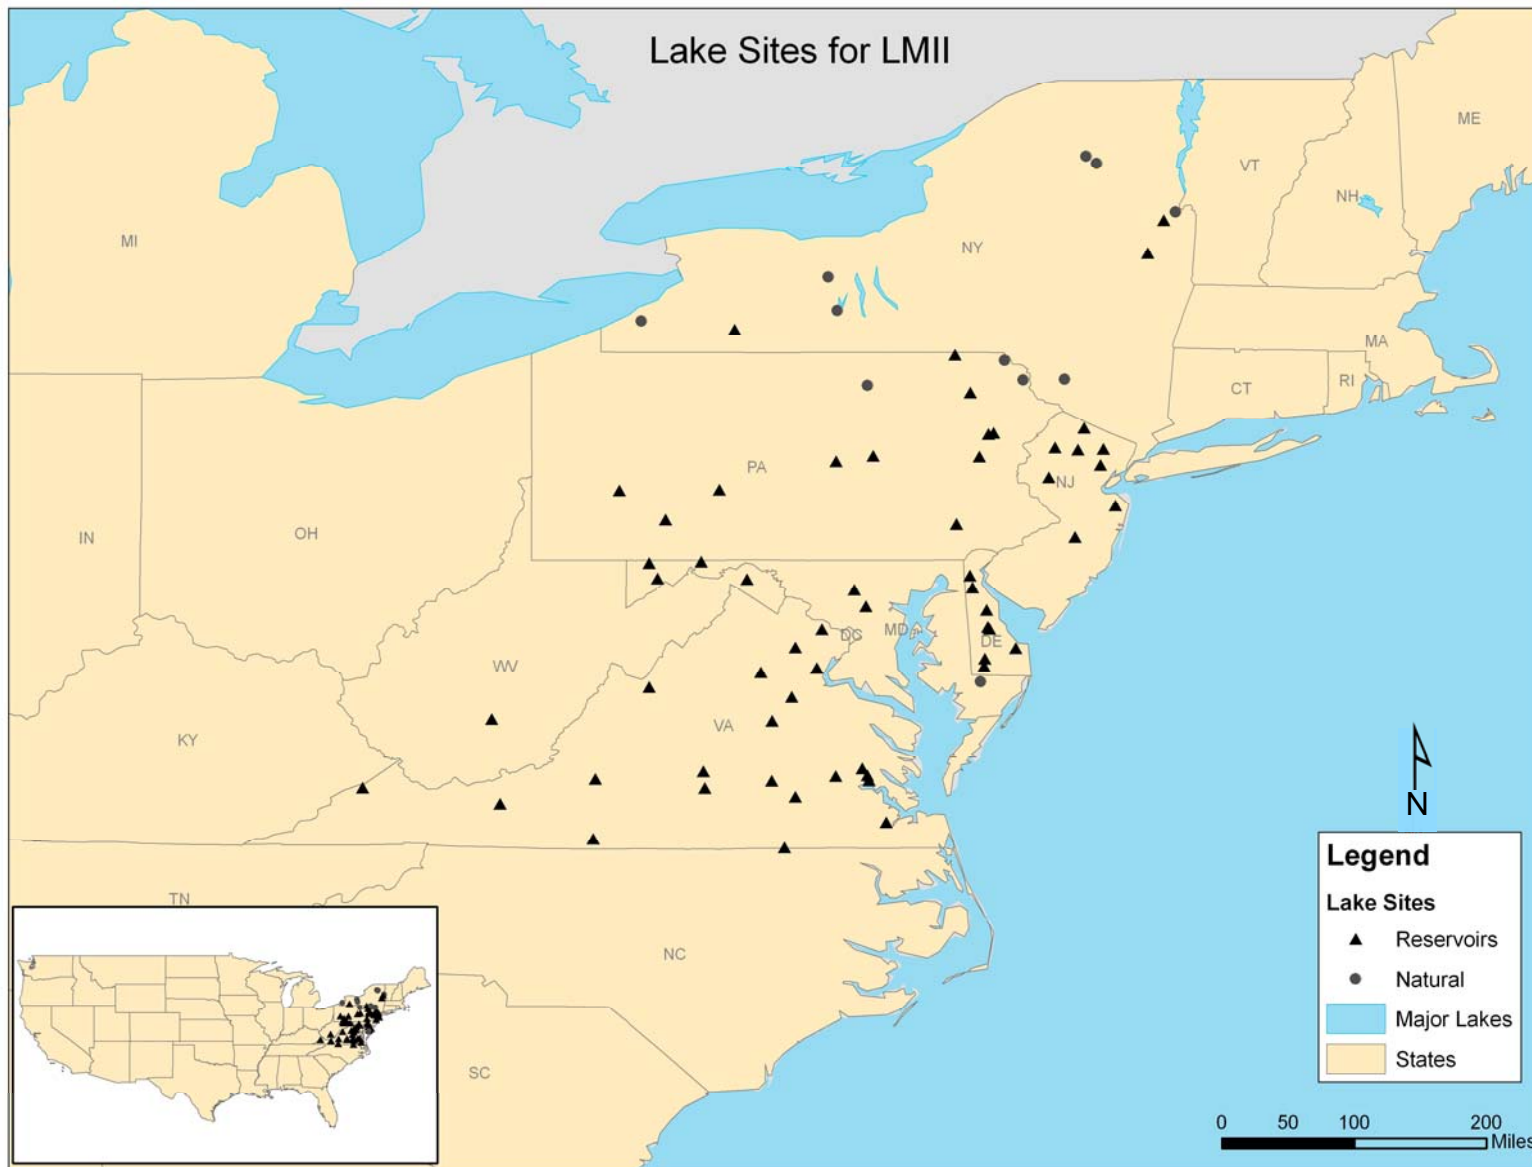

# Study Objectives

- Field validate a genus-level, sub-littoral **Lake Macroinvertebrate Integrity Index (LMII)**.
  - The LMII originally created by Blocksom et al. (2002) using species data from muck and mixed-sediment New Jersey lakes.
- Determine relationships between the LMII, water quality, and physical habitat.
- Examine the regional applicability of the LMII.
- Examine alternate indices using candidate metrics.

# Benthic Field Collection

- Sub-littoral macroinvertebrate assemblage
- Petite ponar grab samples
- Ten randomly-selected locations, composited into a single sample
- Samples wet sieved through wash bucket with 500- $\mu$ m screen
- Specimens preserved with 95% ethanol or 10% formalin

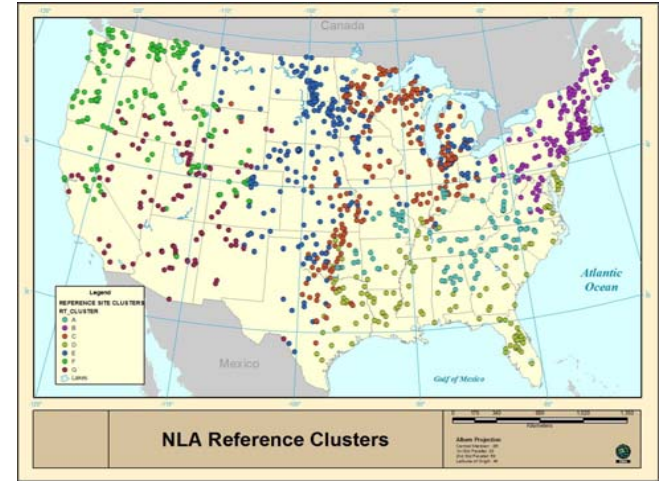

# Lake Data Collected

- *Riparian Zone*: Habitat, Substrate, Macrophytes
- *Littoral Zone*: Habitat, Substrate, Macrophytes, NLA Benthos Sampling
- *Sub-littoral Zone*: Region/State Benthos Sampling
- *Profundal Zone*: Water Chemistry, Nutrients
- Land Use/Disturbance (GIS)
- Lake Level Fluctuations

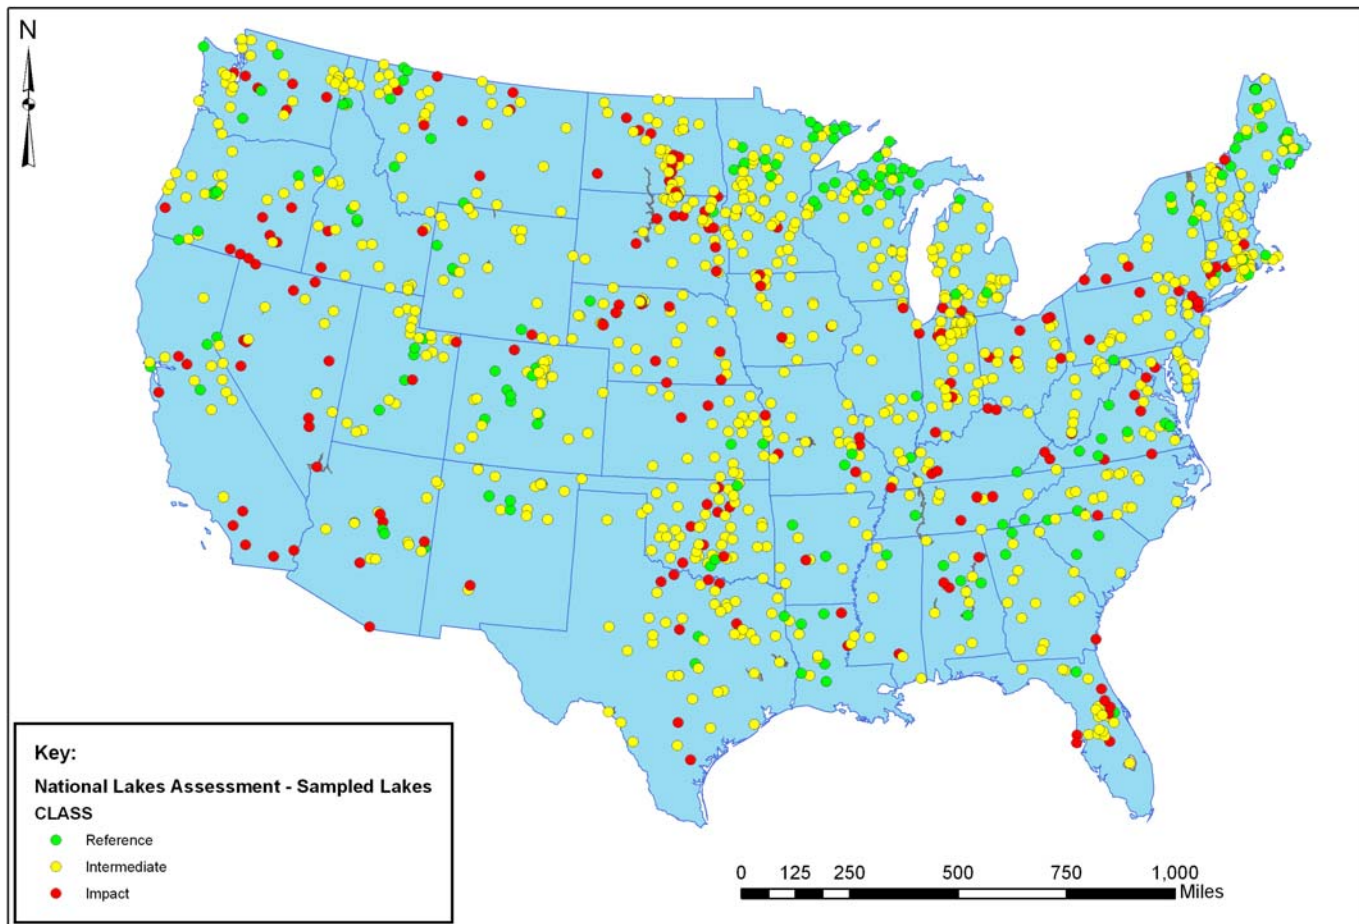

# Step 1: Identify Reference & Impact Sites

- National Lake Assessment (NLA) chemical and land disturbance-based reference/intermediate/impact lake criteria\* used to designate impairment thresholds (\* = by hydrogeomorphic cluster)
- Impairment thresholds used to evaluate sublittoral biotic index discriminatory power

## Step 2: Evaluate LMII Performance

### LMII scores analyzed for:

- Ability to discriminate NLA impairment
- Relationship to habitat, chemistry, and land use

### Findings:

- LMII discriminated NLA impairment poorly
- Generally, few significant relationships

# LMII

## Metrics:

# Diptera taxa

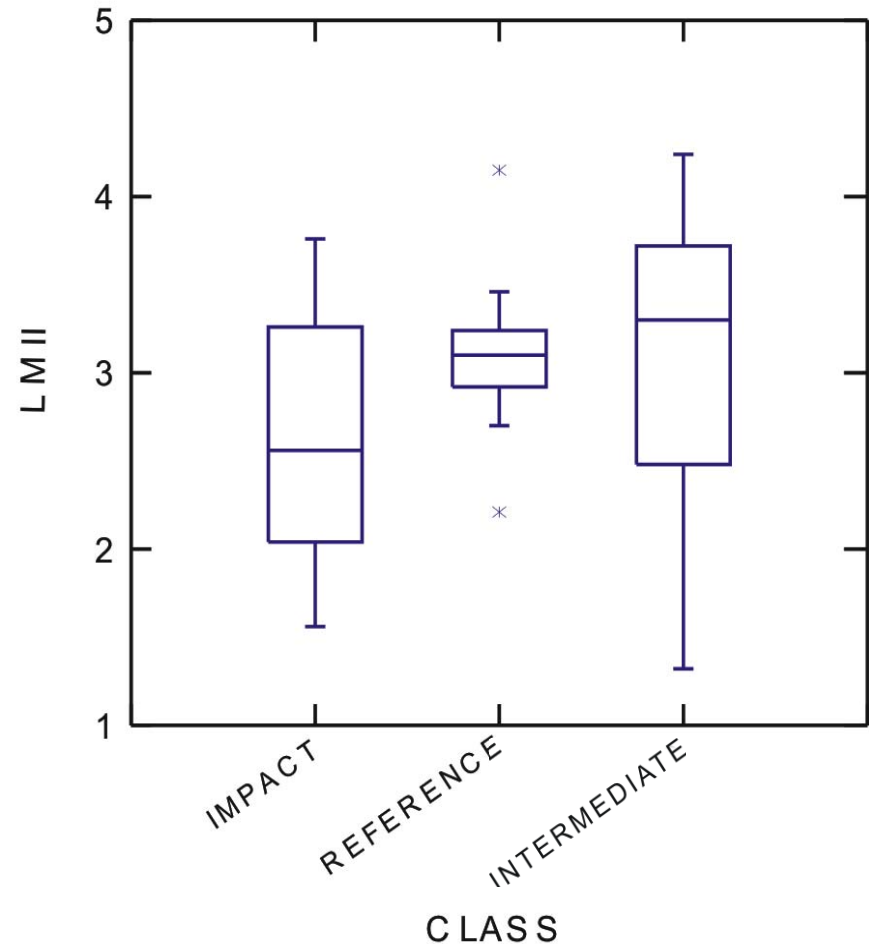

% chironomid individuals

% oligochaetes/leeches

% collector-gatherer taxa

Hilsenhoff Biotic Index

(Blocksom et al. 2002)

## Step 3: Evaluate LMII with Lake Classification

Boxplot analysis split by lake types:

- Sediment (sand, muck, or mixed/intermediate)
- Conductivity (hard or soft)
- Origin (natural or reservoir)
- USEPA Region II or III

#### SEDIMENT CATEGORY

- Intermediate
- Muck
- Sand

CONDUCTIVITY TYPE

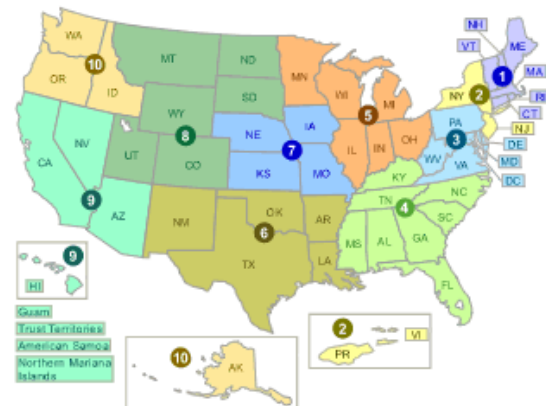

- Hard
- Soft

STATUS

- Man-made
- Natural

EPA REGION

- Region 2
- Region 3

## Step 4: Analysis of Candidate Metrics

- Richness measures (e.g., total number of taxa)
- Tolerance measures (e.g., % intolerant taxa)
- Composition measures (e.g., % non-insects)
- Trophic measures (e.g., % predator taxa)

# Environmental Data Analysis

- Principal components analysis (PCA) used to detect major patterns of environmental variation
- Spearman Rank correlations used to determine strength of associations between metrics and PCA scores + original parameters
- Non-metric multidimensional scaling (NMS) used to look at species gradients; environmental joint plot overlays

# Step 5: Alternate Index Development

Metrics selected by:

- Distributional relevance
- Discriminatory power
- Relationships to stressors
- Lack of redundancy

# Alternate Index 1

## Metrics:

Avg. score per taxon (ASPT)

% facultative individuals

% predator taxa

# Diptera taxa

% tolerant taxa

# Alternate Index 2

## Metrics:

HBI

# chironomid taxa

# individuals per taxon

# predator taxa

Simpson diversity

# Spearman Correlations ( $p < 0.01$ )

## LMII:

riparian substrate, lab pH, conductivity, ANC, SiO<sub>2</sub>, PCA Axis 1

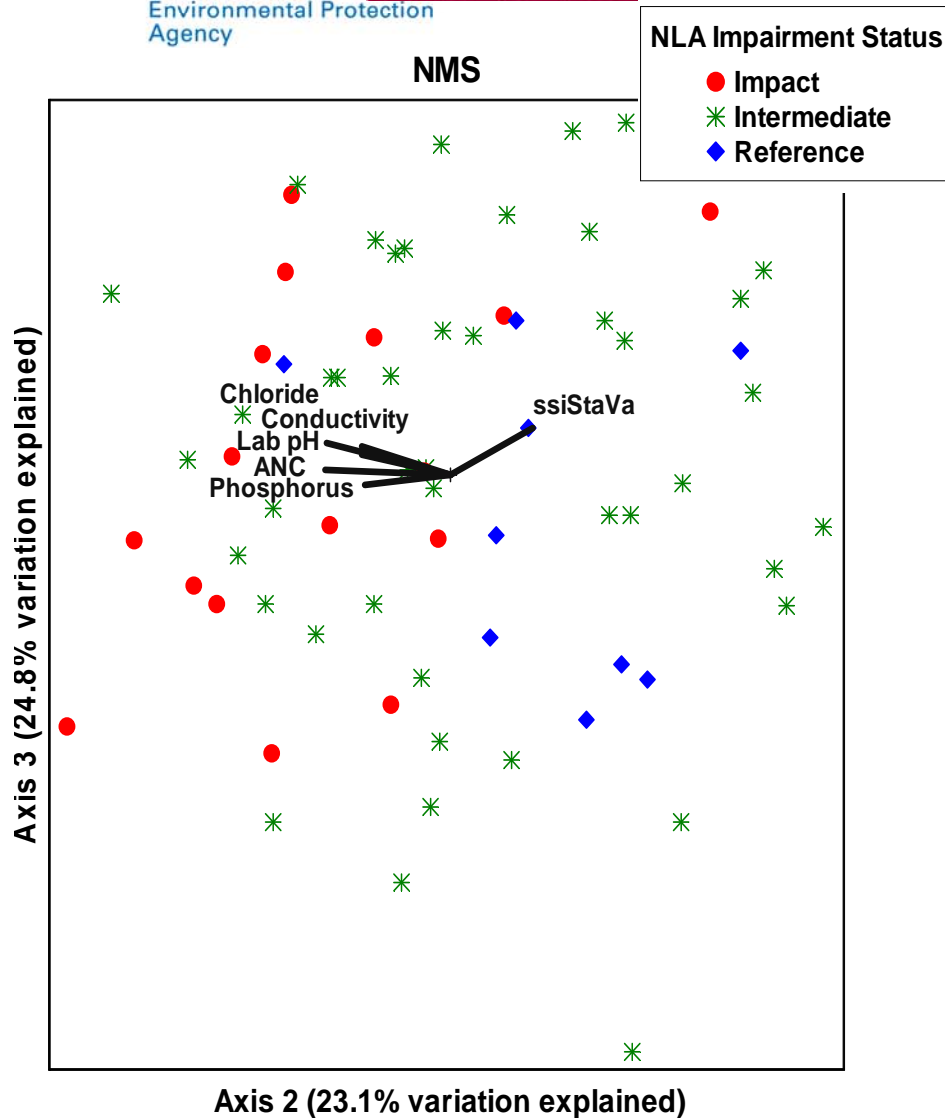

## Alternate Index 1:

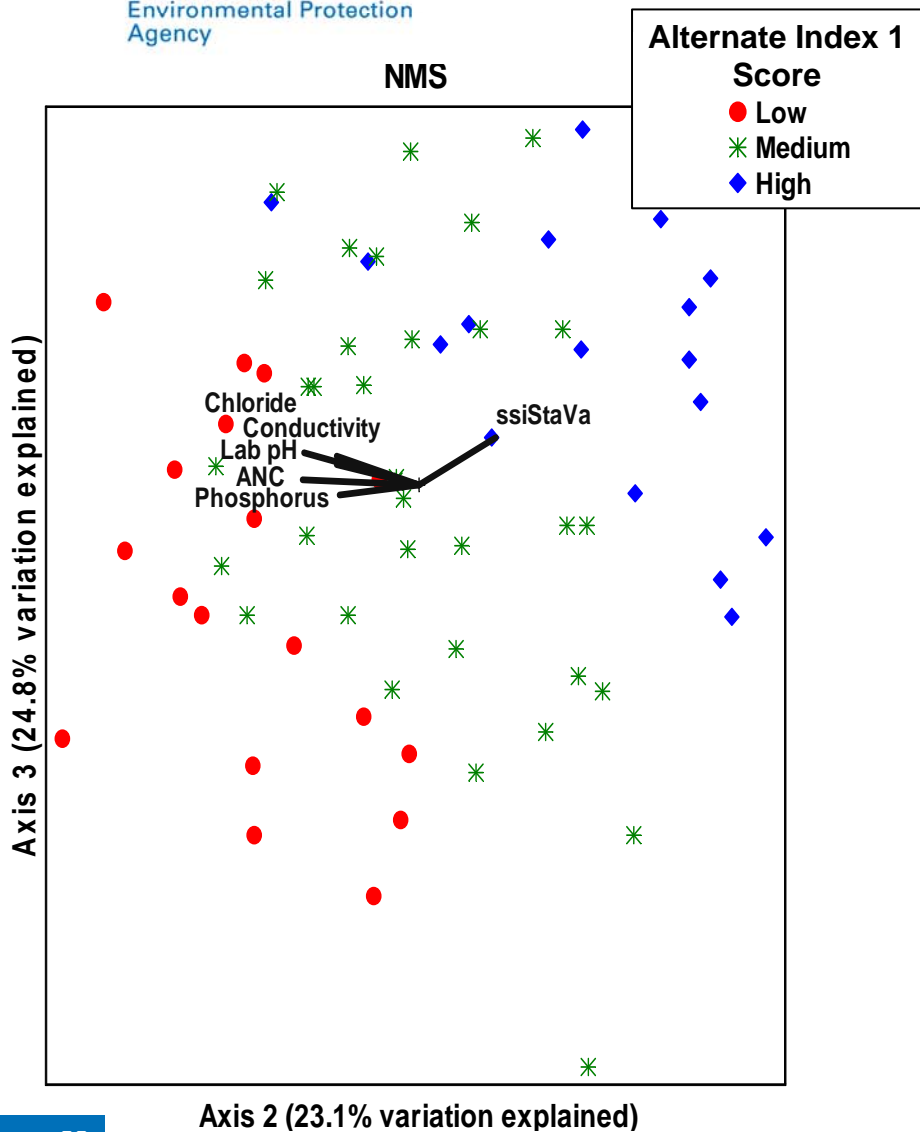

riparian substrate, littoral substrate, ANC, turbidity, TOC, DOC, PTL, SiO<sub>2</sub>, Chl-a, secchi, PCA Axis 1

## Alternate Index 2:

riparian substrate, littoral substrate, turbidity, TOC, DOC, PTL, SiO<sub>2</sub>, Chl-a, secchi, PCA Axis 1

ANC = Acid Neutralizing Capacity; SiO<sub>2</sub> = Silica; TOC = Total Organic Carbon; DOC = Dissolved Organic Carbon; PTL = Total Phosphorus

# Conclusions

- Alternate Indices superior to LMII across the study area; LMII performance in Region II > Region III
- Sub-littoral macros link to water chem and substrate
- Alternate Index 1 best differentiates biological reference status; heavy pollution focus
- Boxplots discriminate NLA impact and reference lakes; intermediate distributions unclear
- Variability could be attributed to broad typology of lakes included in the NLA

# Recommendations

- Use these indices as a starting point in developing your lake bioassessment program
- Selection of which index to use currently depends on known gradients and study objectives
- Future sampling and research will advance our understanding of zonal community interactions and the natural environmental variables to which lake macroinvertebrates respond
